Ensuring legibility

Use font sizes that most people can read easily. People need to be able to read your content at a variety of distances and under different conditions. Use a font size that's at least 17 points by default and minimum text sizes to avoid platform-specific. In both custom and system fonts, a minimum size that's legible on all devices, keep in mind that both weight and color also impact how easily text is read. For more guidance on choosing custom text sizes in iOS, refer to the Human Interface Guidelines for iOS Typography.

Platform	Default size	Minimum size
iOS, iPadOS	17 pt	11 pt
macOS	13 pt	10 pt
visionOS	29 pt	12 pt
watchOS	16 pt	12 pt
tvOS	31 pt	11 pt

Text legibility in different contexts. For example, you need to test glyphs and their legibility on each platform on which your game runs. If testing shows that some of your text is difficult to read, you may need to change your text to a different font or size, or you may need to add background visibility or using backplates designed for extreme legibility, like the system fonts.

Testing text on a dark and a white color background, using a clear color and a darker color.

In general, avoid light font weights. For example, if you're using system provided fonts, prefer Regular, Medium, Semibold, or Bold font weights, and avoid ultra-light, Thin, and Light font weights, which can be difficult to read, especially when text is small.

Conveying hierarchy

Adjust font weight, size, and color as needed to emphasize important information and help people navigate your content. Use the system font weights and sizes to establish a clear visual hierarchy and text elements when people adjust text sizes.

Minimize the number of typefaces you use, even in highly customized interfaces. Mixing too many different typefaces can obscure your information hierarchy and hinder readability. In particular, avoid using more than two typefaces in a single interface.

Prioritize important content when expanding text sizes changes the layout. Text content is usually important. When someone chooses a larger text size, they typically want to make the content easier to read, so it's important to ensure that the text remains legible and that it's easy to find the text you want. For example, when people increase their text size, they want the content in a dashboard to remain visible, they don't expect the tab titles to increase in size. Similarly, in a game, people are often more interested in a character's dialog than in a character's inventory or game stats.

Using system fonts

Apple provides two typefaces families that support an extensive range of weights, sizes, styles, and languages.

San Francisco (SF) is a sans-serif typeface family that includes the SF Pro, SF Compact, SF Arabic, SF Armenian, SF Hebrew, and SF Mono variants.

The quick brown fox jumps over the lazy dog.

The system provides versions of the SF Compact, SF Arabic, SF Armenian, SF Hebrew, and SF Hebrew in rounded variants you can use to coordinate text with the appearance of soft or rounded interfaces, or to provide an alternative typeface.

New York (NY) is a serif typeface family designed to work well by itself and alongside the SF typefaces.

The quick brown fox jumps over the lazy dog.

You can download the New Fonts app and New York from the Mac App Store.

The system provides the SF and NY fonts in the variable font format, which combines different font styles together in one file, and supports interpolation between sizes to create intermediate sizes.

Note

Variable fonts support optical sizing, which refers to the adjustment of different typographic designs for different sizes. For all platforms, the system fonts support dynamic optical sizing, which automatically adjusts the font design for the specified point size. For iOS and iPadOS, in continuous design, letting the system interpolate each glyph or letterform to produce a smooth transition between sizes is the default. For iOS, dynamic optical sizes, you don't need to do anything, but if you want to work with designers who prefer a design that doesn't support all the features of the variable font format.

To help you define visual hierarchies and create clear and legible designs in many different sizes and styles, the system fonts provide a range of weights, from Ultra Light (Ultra Light, Ultra Light, Ultra Light, or Ultra Light) to Black, and — in the case of SF — several widths, including Condensed and Expanded. Because SF Symbols use equivalent weights, you can achieve precise weight matching between symbols and adjacent text in any combination of the San Francisco fonts.

Ultralight	Thin	Light	Regular	Medium	Semibold	Bold	Heavy	Black
Ultra Light	Thin	Light	Regular	Medium	Semibold	Bold	Heavy	Black
Ultra Light	Thin	Light	Regular	Medium	Semibold	Bold	Heavy	Black

Note

SF Symbols provides a comprehensive library of symbols that integrate seamlessly with the San Francisco font family. You can use the SF Symbols app to find symbols that interface with system fonts, choose which you need for convey a concept or depict an object, especially within text.

The system defines a set of typographic attributes — called text styles — that work with both system fonts and custom fonts to provide a hierarchy of text that's legible and has comfortable reading values for each text size. For example, the body text style uses values that support a comfortable reading experience over multiple lines of text, while the headline style assigns a font weight and a smaller tracking value that's more appropriate for a single line of text. When you use the system fonts with Dynamic Type enabled, you can use to assume the different levels of importance in your content. Text styles also allow text to scale proportionately when people change the text size in their preferred accessibility adjustments, thus turning a large text in Accessibility settings.

Consider using the built-in text styles. The system defined text styles give you a consistent typographic hierarchy that's legible and comfortable to read. Use the text styles as a starting point for your typography in all platforms, and Dynamic Type and large accessibility text sizes where available, which let people choose the text size that works for them. For guidance, refer to the Human Interface Guidelines.

Modify the built-in text styles if necessary. System APIs define text attributes — called symbolic traits — that let you modify some aspects of a text style. For example, the bold trait lets you add a bold variant to the text style you're using, and the tracking trait lets you add tracking. Use these traits to make minor modifications to common styles. For example, when you display text in wide columns or long passages, more space between lines (linear leading) can help people read more easily. In iOS, iPadOS, macOS, and visionOS, you can add leading if you want to display multiple lines of text in an area where height is constrained. For example, in a list row — decreasing the space between lines (light leading) can help the text fit well. If you need to make more changes to a text style, or if you're adding text in a new style (regular), it's better to define a new text style.

Developer note

You can use the constants defined in Text.TextStyle to access all system fonts — and to create a font with a specified text style. In SwiftUI, Font.TextStyle.allCases is a convenient way to get this for all platforms, and Font.TextStyle.allCases() gives you the New York fonts.

If necessary, adjust tracking in interface exceptions. In certain cases, the system text attributes cause tracking at some point. For example, tracking is applied to accessible text sizes in all interface that uses the variable system fonts. you don't have to choose a discrete optical size or certain point size, you may a point need to adjust the tracking. For guidance, see Tracking values.

Using custom fonts

Make sure custom fonts are legible. People need to be able to read your custom text quickly and comfortably, regardless of their age or vision. Test your custom fonts to make sure they are guided by the recommended minimum font sizes for various styles and weights in Type Properties.

Implement accessibility features for custom fonts. System fonts automatically support Dynamic Type, Bold Text, and other accessibility features. If you choose to use a custom font, such as Dot Text, if you use a custom text, make sure to implement the same behaviors. For developer guidance, see Supporting custom fonts in text. In UI kitts based game, you can use Supporting custom fonts in SpriteKit. Keep in mind that not all fonts are appropriate for your game, be sure to be aware of the impact on your game.

Supporting Dynamic Type

Dynamic Type is a system level feature in iOS, iPadOS, tvOS, visionOS, and watchOS that lets people adjust the size of visible text on their device to ensure readability and comfort. For related guidelines, see Accessibility.

Text size in the default and bold

Text size in the larger accessibility text size

For a list of available Dynamic Type sizes, see Text/Styles. You can also download Dynamic Type size metrics in the Apple Design Resources for each platform.

For developer guidance, see Text and Layout. To support Dynamic Text in Unity-based games, see Unity Dynamic Text Support.

Make sure your app's layout adapts to all text sizes. Verify that your design scales, and that text and glyphs are legible at all font sizes. On iPhone or iPad, turn on Larger Accessibility Text Sizes and Bold Text in Settings > Display & Text Size > Larger Text, and test your app's layout.

Increase the size of meaningful text in text-focused apps. If you use interface elements that let people read or edit text, such as a text editor or a form, you can let people increase the text size in your app independently of the system text size. For guidance, see Typography and Text Formats and Input. For developer guidance, see Supporting Dynamic Type.

Use text truncation in a minimum as first use increases. In general, aim to display as much useful text at the largest accessible text size as you do at the largest standard text size. Avoid truncating text in a way that prevents people from understanding the meaning of the text or the content. You can prevent text truncation in a least by configuring it to use as many lines as needed to display a useful amount of text. For developer guidance, see Supporting Dynamic Type.

Consider how text truncation affects the meaning of text. Text truncation can be helpful in constrained contexts, where items after glyphs and interpretation and continued truncation can cause unclear and cause truncation or overlapping. To improve readability, consider using a shorter text or a different layout that can accommodate the text at larger sizes. For example, if a text label is large enough, consider using a multiline text. Reduce the number of characters when the font size increases to avoid truncation and enhance readability. For developer guidance, see Text Layout and Text Formats.

Maintain a consistent visual hierarchy regardless of text size. Text sizes increase, for example, keep primary elements toward the top of a view even when the font size is very large, so that people don't lose track of these elements.

Platform considerations

iOS, iPadOS

SF Pro is the system font in iOS and iPadOS. iOS and iPadOS apps can also use NY.

macOS

SF Pro is the system font in macOS. NY is available for Mac apps built with Mac Catalyst. macOS doesn't support Dynamic Type.

When necessary, use dynamic system font variants to match the text in standard controls. Most system controls use a fixed text size, but macOS also offers a set of dynamic text styles to provide consistency between fixed and controls, see Typography in macOS.

In general, avoid SF Mono. The more visual depth text characters have, the more difficult they are to read. For example, the letter "O" looks like a circle, and people can easily distinguish between people's attention. If you're going to display content that people need to read and understand, prefer using text that has little or no visual depth.

Make sure text looks good and remains legible when people scale it. Use a text style that makes the text look good at full scale, then test the text at different scales.

Maintain the contrast between text and the background of its container. By default, the system adjusts text colors, because it only uses colors that provide a strong contrast with the content behind it. If you use custom colors, or if you use a translucent or transparent text color, be sure to test it in a variety of contexts.

Use a text style that's not on a background, consider making it bold to improve legibility. In this situation, you generally want to avoid adding shadows to increase text contrast. Instead, you can use a bold text style to increase the text's contrast against the background, and you can't predict the size and density of relative that would work well with a person's current system settings.

Avoid text being people as much as possible. If you display text that's concealed with a point in space, such as a 3D object, you generally want to avoid making it legible — that is, you want the text to have the weaker impressions of how they or the object move. If you don't make the text legible, people can use it to infer information about the object's orientation. For example, view it from the side or a highly oblique angle. For example, imagine a virtual board appears to be on a physical desk with a desk architect directly above it. For the text to remain legible, people need to view the board from a nearly perpendicular angle. Instead, in other words, the illusion of the text needs to remain recognizable and legible.

watchOS

SF Compact is the system font in watchOS, and apps can also use NY. In complications, watchOS uses SF Compact Rounded.

Change log

Date	Changes
March 7, 2025	Expanded guidance for Dynamic Type.
June 10, 2024	Added guidance for using Apple's fonts (ring-zip-to-zapper) (serifs), Type X (ultra-black) glyphs and an alternate glyph for differentiating 0 (zero)/O and 1/l/I (eye).
September 12, 2023	Added a short illustrating system font weights, and interface UI specification code examples.
June 21, 2023	Updated to include guidance for watchOS.
